

collect_training_data.py

This script is designed to collect training data for a machine learning model. It does this by fetching data from a specified source and storing it in a local database.

Import necessary libraries

```
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
```

Define the function to collect training data

```
def collect_data():
    # Fetch data from the source
    data = pd.read_csv('data.csv')

    # Preprocess the data
    data = data.dropna() # Remove rows with missing values
    data = data.apply(lambda x: x.astype(str).str.lower()) # Convert all values to lowercase

    # Split the data into training and testing sets
    train_data, test_data = train_test_split(data, test_size=0.2, random_state=42)

    # Scale the data
    scaler = StandardScaler()
    train_data = scaler.fit_transform(train_data)
    test_data = scaler.transform(test_data)

    # Store the data in the local database
    train_data.to_csv('train_data.csv', index=False)
    test_data.to_csv('test_data.csv', index=False)
```

Call the function to collect training data

```
collect_data()
```
